

# Inhaler carbon footprint comparison tool

Your doctor, nurse or pharmacist will use this table to help you choose a more environmentally friendly inhaler that is good for you and the environment.

The NHS supports the change to more an environmentally friendly inhaler if this is the right choice for you. NHS research has shown that people are willing to change to a more environmentally friendly inhaler.

## How to use the inhaler carbon footprint table

- Inhalers have been put into alphabetical order by inhaler name in the contents list. There is also a list of inhaler types. These lists are interactive, so when you click on the inhaler brand or type you wish to view, you will automatically jump to that page.
- The table includes photos of the inhalers, a list of their active ingredients, and the type of inhaler.
- The symbol next to the inhaler indicates whether it has a:

Low (green) carbon footprint

Medium (orange) carbon footprint or

High (red) carbon footprint

- Inhalers with a green low carbon footprint are more environmentally friendly.

Using this tool with your doctor, nurse or pharmacist means you can talk about which environmentally friendly inhalers may be suitable for you to consider.

## Which inhaler devices are less environmentally friendly?

Metered dose inhalers (MDIs), sometimes called 'pumps' or 'puffers' are less environmentally friendly. They contain a gas (propellant) that is a powerful greenhouse gas which adds to global warming. They have a red high carbon footprint symbol next to them in the table.

Some metered dose inhalers have less of the greenhouse gas in the inhaler. They have an orange medium carbon footprint symbol next to them in the table.

## Which inhaler devices are more environmentally friendly?

Dry powder inhalers (DPIs) or soft mist inhalers (SMIs) do not contain greenhouse gases and so have a lower carbon footprint. They are more environmentally friendly and have a green low carbon footprint symbol next to them in the table.

## What should I do if I need to use a high carbon footprint inhaler and I am concerned about the environment?

It is really important to keep taking the medicines that you need, particularly your regular maintenance or preventer inhaler which can help prevent exacerbations and reduce the need for rescue treatments.

There are still steps you can take to reduce the carbon footprint, like:

- Ensuring you use your inhaler with good technique.
- Using your inhaler until empty and know how to tell when your inhaler is empty.
- Return your empty or no longer needed inhalers to a community pharmacy or dispensary for environmentally friendly disposal.
- Keeping physically active and stopping smoking are also really important ways to improve your lung health without relying on medicines.

## Symbols, abbreviations and terms used in this tool

	Low carbon footprint inhaler
	Medium carbon footprint inhaler
	High carbon footprint inhaler
<b>BA-pMDI</b>	Breath actuated pressurised metered dose inhaler
<b>Bronchodilator</b>	Bronchodilators help the muscles around the airways to the lungs relax, to keep them open and stop them getting tight. This helps air get in and out of the lungs better to make breathing easier.
<b>DPI</b>	Dry powder inhaler
<b>ICS</b>	Inhaled corticosteroid. Also known as a steroid inhaler.
<b>LABA</b>	Long-acting beta-2 agonist. LABA inhalers are like SABA inhalers, but their effects last longer and they may not start to work as quickly. They contain different medicines compared to SABA inhalers.
<b>LAMA</b>	Long-acting muscarinic antagonist. LAMA inhalers are like SAMA inhalers, but their effects last longer and they may not start to work as quickly. They contain different medicines compared to SAMA inhalers.
<b>MART</b>	Maintenance and reliever therapy. Inhaler strengths that can be used in asthma MART regimes are listed in the table.

<b>pMDI</b>	Pressurised metered dose inhaler
<b>Preventer inhaler</b>	Preventer inhalers, taken everyday, contain ICS, which reduce swelling or inflammation in the lungs making it easier to breathe. They also shield you from your triggers if you have asthma.
<b>SABA</b>	Short-acting beta-2 agonist. SABA inhalers contain a medicine that relaxes the muscles in your lungs and so open up your airways. They make it easier to breathe or stop you from wheezing. The medicine in the inhaler is either salbutamol or terbutaline.
<b>SAMA</b>	Short-acting muscarinic antagonist. SAMA inhalers relax the muscles in your lungs and so open up your airways. They contain a medicine called ipratropium.
<b>SMI</b>	Soft mist inhaler
<b>Triple therapy</b>	ICS+LABA+LAMA
